

Instruction Sheet for Participants

You will perform a dual-task experiment in which you should focus on both tasks simultaneously. You will look at a computer screen in a quiet, dimly lit room. Position your head accordingly to the forehead and chin rest to ensure accurate eye tracking. It is therefore important to move and blink less as possible! A fixation point will appear at the center of the screen. You should look at it throughout the whole experiment. You will hear a feedback sound, whenever the fixation is broken.

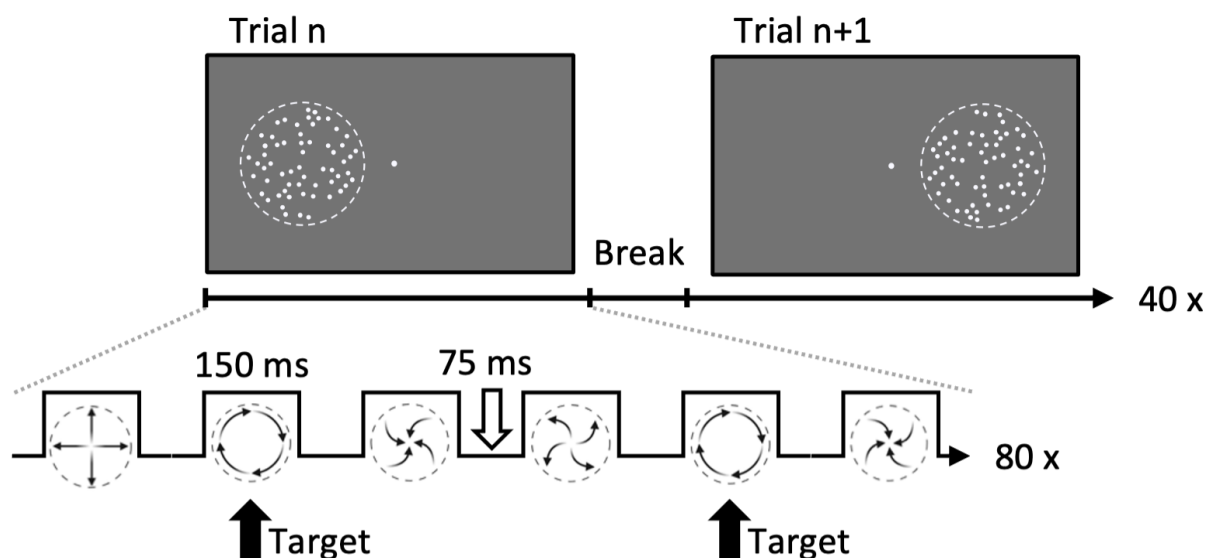

Fig.1 Schematic sequence of an example trial with clockwise rotation as assigned target motion.

The experiment contains 2 sessions with each containing 4 blocks (40 trials each) and 2 blocks (20 trials each) for additional training. Each session only uses one motions pair (either CW and CCW or EXP and CON) as possible target motion. Before each block the assigned target motion is shown to you. As you perform the task, focus on both the luminance change of the fixation point and the motion pattern. Make sure to **respond as quickly and as accurate** as possible when you have seen the **luminance change** or the **target motion**. You can take a break between each trial. But you should **not move your head!**

Secondary Task:

Press the **RIGHT Trigger** when you perceived the **target motion**.

Primary Task:

Press the **LEFT Trigger** when you perceived the **luminance change** of the fixation point.

Fig.2 Assigned response buttons. Note that button assignment is reversed if you are left-handed.
